TOSHIBA

Security Guide Vol.6.9

January, 2025

* This service is not available under this name, e-BRIDGE SKY Suite™, in the European region.

TOGETHER INFORMATION

TABLE OF CONTENTS

Trademarks

The trademarks described in this manual are as shown below.

- Windows, and the brand names and product names of other Microsoft products are trademarks of Microsoft Corporation in the US and other countries.
- MIFARE is a trademark of NXP Semiconductors.

Other company names and precuts names in this document are the trademarks of their respective companies.

1. PREFACE

Toshiba Tec Corporation (hereafter called "Toshiba Tec") guarantees the security of your data and documents for enabling your business to meet the increased security demands of today's world. All our e-BRIDGE Next models conform with the highest security standards, preventing your data and documents from any unauthorized access without sacrificing the efficiency and performance of the systems.

Model and series names in this manual

In this manual, each model name in the sentences is replaced with the series name as shown below.

Model name	Series name
e-STUDIO550/650/810	e-STUDIO810 Series
e-STUDIO3511/4511	e-STUDIO4511 Series
e-STUDIO600/720/850	e-STUDIO850 Series
e-STUDIO281C/351C/451C	e-STUDIO451C Series
e-STUDIO232/282	e-STUDIO282 Series
e-STUDIO352/452	e-STUDIO452 Series
e-STUDIO2500C/3500C/3510C	e-STUDIO3510C Series
e-STUDIO163/165/205	e-STUDIO205 Series
e-STUDIO166/167/207	e-STUDIO207 Series
e-STUDIO2330C/2820C/2830C/3520C/4520C	e-STUDIO4520C Series
e-STUDIO5520C/6520C/6530C	e-STUDIO6530C Series
e-STUDIO255/355/455	e-STUDIO455 Series
e-STUDIO655/755/855	e-STUDIO855 Series
e-STUDIO2040C/2540C/3040C/3540C/4540C	e-STUDIO4540C Series
e-STUDIO5540C/6540C/6550C	e-STUDIO6550C Series
e-STUDIO206L/256/306/356/456/506	e-STUDIO506 Series
e-STUDIO556/656/756/856	e-STUDIO856 Series
e-STUDIO2050C/2550C	e-STUDIO5055C Series
e-STUDIO2555C/3055C/3555C/4555C/5055C	
e-STUDIO306LP	e-STUDIO306LP Series
e-STUDIO5560C/6560C/6570C	e-STUDIO6570C Series
e-STUDIO207L/257/307/357/457/507	e-STUDIO507 Series
e-STUDIO557/657/757/857	e-STUDIO857 Series
e-STUDIO2000AC/2500AC	e-STUDIO5005AC Series

	User authentication function (Two-factor authentication)	Yes	Yes	Yes	Yes	Yes
	User authentication function (NFC authentication)			Yes	Yes	Yes
	Administrator privilege password authentication	Yes	Yes	Yes	Yes	Yes
	Restrict service technician to access	Yes	Yes	Yes	Yes	Yes
	Password authentication (BOX password)	Yes	Yes	Yes	Yes	Yes
	Record various security logs	Yes	Yes	Yes	Yes	Yes
	Log records whether copying/printing/scanning by user succeeded or failed	Yes	Yes	Yes	Yes	Yes
	Restriction of editing Address Book	Yes	Yes	Yes	Yes	Yes

Possible dangers	Functions	e-STUDIO5055C Series e-STUDIO6570C Series e-STUDIO507 Series e-STUDIO857 Series	e-STUDIO5005AC Series e-STUDIO5008A Series e-STUDIO7506AC Series e-STUDIO8508A Series	e-STUDIO5008LP Series	e-STUDIO5015AC Series e-STUDIO5018A Series e-STUDIO7516AC Series e-STUDIO8518A Series e-STUDIO400AC Series	e-STUDIO6525AC Series e-STUDIO6528A Series e-STUDIO7527AC Series e-STUDIO9029A Series
	Access restriction to logs	Yes	Yes	Yes	Yes	Yes
	Syslog	Yes	Yes	Yes	Yes	Yes

Note 1: There is no plan to obtain the CAVP authentication for the e-STUDIO400AC Series.

2.2 Glossary

Term	Description
AES	Abbreviation for Advanced Encryption Standard This is a symmetric-key encryption algorithm. For the SED SSD, FIPS certified SSD, Security HDD with the Wipe function and FIPS/JCMVP certified HDD, 256-bit AES is adopted for encryption. Even when an HDD or SSD without an encryption function is installed, enabling software encryption on the MFP allows data to be stored on the HDD or SSD in an encrypted state using either the 128-bit or 256-bit AES.
HDD	Abbreviation for Hard Disk Drive. This is a storage device that magnetically records data. Many HDDs have a large capacity for data storage.
SSD	Abbreviation for Solid State Drive Compared to HDD, an SSD has advantages such as faster reading and writing speed of data, higher shock resistance, and lower power consumption. Recently, an internal storage of notebook and desktop computers is shifting from an HDD to an SSD, and adoption in other companies' MFPs is also increasing.
SED	Abbreviation for Self-Encryption Drive This is a storage device such as an HDD or an SSD that has built-in hardware to encrypt all data on the storage.
Overwrite feature	This is a function that completely erases job data such as printing, copying, and scanning temporarily stored on the HDD. For details about this function, refer to "3.3.1 Overwrite feature of HDD data".
TPM2.0	Abbreviation for Trusted Platform Module This is the latest standard formulated by the Trusted Computing Group (TCG). This provides security functions to protect confidential data such as encryption keys and passwords.
Wear Leveling	This is a function that controls data writing to a storage device such as a flash memory and an SSD to prevent concentration of writes on specific blocks. By evenly distributing writes, it extends the lifespan of the product's cells and prevents failures or data loss.

TRIM function	This is a feature that requests the SSD to forcibly free up new writing areas by instructing the deletion of files or data from the MFP itself. In an SSD, even when stored data are deleted, the area is only marked as "unnecessary data" and the data are not actually erased. The original data remain in the SSD until new data are overwritten in this area. When the TRIM command is issued from the MFP, the "unnecessary data" marked in the SSD are immediately erased. This process prevents "unnecessary data" from remaining in the SSD for extended periods, further increasing the difficulty of data recovery.
FIPS	Abbreviation for Federal Information Processing Standards This is a set of standards and guidelines related to computer systems established by the National Institute of Standards and Technology (NIST) based on the Federal Information Security Management Act (FISMA). FIPS 140-2, in particular, provides criteria for evaluating whether cryptographic modules (software or hardware involved in encryption) can maintain an appropriate level of security, primarily aimed at protecting information within government agencies and related organizations.
JCMVP	Abbreviation for Japan Cryptographic Module Validation Program This is a Japan's third-party conformity assessment system to objectively confirm that the security functions of a cryptographic module are correctly implemented and that the security of essential information such as the keys is ensured.
Security HDD with the Wipe Function	This is an HDD equipped a function that automatically erases encryption keys and invalidates data when they are removed from the device. AES (256-bit) is used for encryption strength.
FIPS/JCMVP certified HDD	This is an HDD certified by FIPS 140-2 and JCMVP. AES (256-bit) is used for encryption strength.
FIPS certified SSD	This is an SSD certified by FIPS 140-2. AES (256-bit) is used for encryption strength.

3. DEVICE SECURITY

At every layer of the technology stack, Toshiba Tec protects our MFPs from any undesirable occurrences such as an unauthorized access, to ensure complete security through the entire lifecycle of the device from installation and operation to the end of its life.

3.1 Protection of HDD/SSD Data

An HDD (Hard Disk Drive) or an SSD (Solid State Drive) is equipped in TOSHIBA MFPs with the e-BRIDGE controller installed. Scanned original document data in copying are stored temporarily in the HDD/SSD. When copying is completed, although the management information (FAT: File Allocation Table) is erased, the temporarily stored data still remain in the HDD/SSD. In addition, a confidential document can be stored and controlled with a password in an e-Filing box of the HDD/SSD. Some customers may be concerned that if a person with bad intent steals the HDD/SSD, the person can recreate a document from residual data or data in an e-Filing box and may be able to access confidential and private information. However, by utilizing the following encryption function and data overwriting function, the HDD/SSD data can be protected.

3.2 Data Encryption Function

3.2.1 Security HDD with the Wipe function

A security HDD with the Wipe function is equipped on the e-STUDIO5005AC Series, e-STUDIO5008A Series, e-STUDIO7506AC Series, e-STUDIO8508A Series and e-STUDIO5008LP Series as the default.   For the e-STUDIO5015AC Series, e-STUDIO5018A Series, e-STUDIO7516AC Series, and e-STUDIO8518A Series, the hard disk option (GE-1230) is provided. For the e-STUDIO5525AC Series, e-STUDIO5528A Series, e-STUDIO7527AC Series, and e-STUDIO9029A Series, the hard disk options (GE-1260, GE-1360) are provided. All data on the HDD are encrypted by an AES 256-bit algorithm. Therefore, by the Wipe function, even if the HDD is stolen, data invalidation works to prevent information leakage as soon as the HDD is installed in another device in an attempt to read data illegally out of the HDD.

  After completion of the use of the MFP or at the end of the lease period, all data on the HDD are instantly invalidated and data retrieval is completely disabled, once the service technician has performed this operation on the MFP according to the customer's instructions.

3.2.2 Encryption of data in the HDD/SSD by the software

For the models in which no security HDD with the Wipe function or an SED SSD is installed, an HDD encryption function using the software is embedded as the default and therefore this can be applied. For the e-STUDIO5015AC Series, e-STUDIO5018A Series, e-STUDIO7516AC Series and e-STUDIO8518A Series, 128-bit AES is adopted as the encryption method. For the e-STUDIO6525AC Series, e-STUDIO6528A Series, e-STUDIO7527AC Series and e-STUDIO9029A Series, 256-bit AES is adopted as the encryption method. For the e-STUDIO5525AC Series, e-STUDIO5528A Series, e-STUDIO7527AC Series, and e-STUDIO9029A

Series equipped in which an HDD with the Wipe function HDD or and SED SSD is installed, it is not necessary to enable the encryption function using the software. However, by requesting a service technician to set the MFP to the high security mode, the encryption function using the software will be automatically activated.

3.2.3 SED SSD

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, an SED SSD has been equipped as a standard storage device. Stored data are encrypted by 256-bit AES. Additionally, when the TPM function is enabled, the SED authentication key is stored in the TPM. This ensures that even if the storage device is stolen, the SED authentication key will not be compromised, and it will be impossible to read the data stored on the storage device using an external equipment, thereby preventing information leakage. For details about the TPM, refer to "3.2.5 Data protection by the TPM2.0".

3.2.4 FIPS/JCMVP Certified HDD, FIPS Certified SSD

A security HDD (GE-1230, GE-1260) with the Wipe function certified to FIPS 140-2/JCMVP and an SSD (GE-1350) certified to FIPS 140-2 are provided as options.

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, when an optional storage device is installed, all user data are not stored on the standard SED SSD. Instead, all data are encrypted using the 256-bit AES and stored on the optional FIPS Certified HDD or FIPS Certified SSD. Due to this, it is assured that all user data are protected by encryption certified by FIPS140-2.

In addition, provision of an HDD certified to FIPS for the e-STUDIO6525AC Series and e-STUDIO6528A Series is expired from December 2023 and then an SSD certified to FIPS will be provided instead.

3.2.5 Data protection by the TPM2.0

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, the TPM2.0 function (Intel Platform Trust Technology) provided by Intel CPU has been supported. The TPM function can be enabled in the security settings of the operation panel or by a service technician.

In the past models, data saved by a security HDD with the Wipe function were protected. From the e-STUDIO6525AC Series and e-STUDIO6528A Series; since an authentication key to access an SED SSD (standard storage device), security HDD with the Wipe function (optional storage device), an optional FIPS certified SSD and an optional SED are stored in the TPM. Due to this, even if the chip with the TPM2.0 function is physically removed, information cannot be extracted from the outside, and the safety has been further enhanced. In models with no SED embedded, the HDD encryption function with the software is equipped. Due to this, the encryption key is protected by the TPM, user information is securely protected against unauthorized access. Secure Boot by the TPM has also been supported. For details, see "6.8 Tampering Prevention of Firmware".
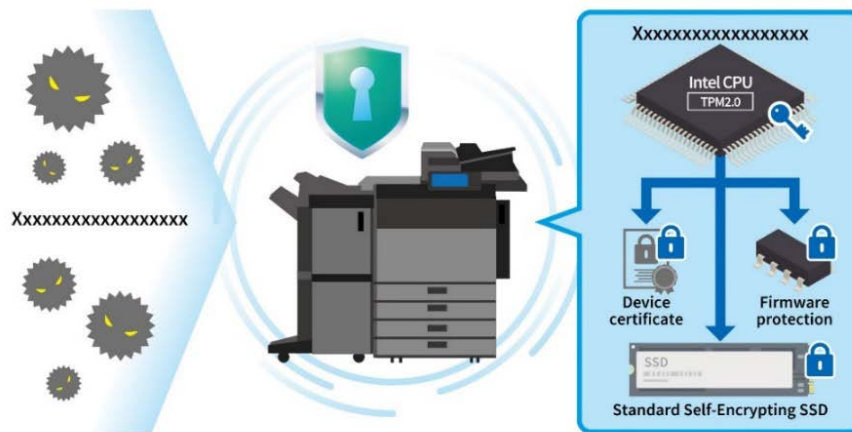

3.3   Overwrite feature

3.3.1 Overwrite feature of HDD data

An HDD record data by utilizing the magnetization patterns on rotating disks covered with magnetic material. Data erasing is achieved by resetting these magnetization patterns, rendering the data meaningless. Furthermore, the security is enhanced by performing overwriting erasure, which involves writing random magnetization patterns multiple times, making data recovery more difficult.

Installation of an optional data overwrite kit (GP-1060/1070) allows data temporarily stored on the HDD from a copying, printing, scanning, faxing or IP-faxing operation to be automatically overwritten and erased by a DOD standard compliant method after the operation is completed. This data overwrite kit also has the function of completely erasing the data in all HDD areas. After completion of the use of the MFP or at the end of the lease period, a service technician will perform this function according to the customer's instructions. Therefore, the recovery of residual data on the HDD is extremely difficult.

Moreover, the encryption function or the Wipe function works on the HDD when a security HDD with the Wipe function or an SED HDD is installed. However, if customers request it, the overwrite feature can be made to function on the HDD by having a service technician enable it. In this case, for the e-STUDIO5525AC Series,

e-STUDIO5528A Series, e-STUDIO7527AC Series, and e-STUDIO9029A Series, the overwrite function can be enabled without the data overwrite kit by installing an optional HDD.

After completion of the use of the MFP or at the end of the lease period, all data can be erased to a state where recovery is extremely difficult, following the customer's request and executed by a service technician.

3.3.2 Overwrite feature of SSD data

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, there is no overwrite feature for the SED SSD equipped as a standard. However, the wear leveling function and TRIM function of the SSD provide similar effects.

The wear leveling function distributes data across the entire storage area. During this process, the information (mapping table) indicating the order in which data are distributed and recorded is periodically updated and discarded, making the data recovery difficult.

Additionally, the periodic TRIM function prevents residual data from remaining in the storage device for extended periods, further increasing the difficulty of data recovery. This reduces the risk of leakage of sensitive information, such as personal data, from the residual data.

Furthermore, when combined with encryption functions, even if the SSD falls into the hands of a third party due to theft, recovering the residual data becomes extremely challenging.

After completion of the use of the MFP or at the end of the lease period, a service technician can initialize the data in the SSD to the factory settings. This initialization method, known as the enhanced erase mode, deletes management data and sets all user areas in the SSD to 0, achieving the same effect as an overwrite erase.

3.4 Network Security

An MFP has a TCP/UPD port opened in order to provide a network service. A client PC is connected to the MFP port that could respond to the service via the network. For example, in order to provide the LPD printing service, 515 ports of the MFP are opened. Some customers may be concerned that if an unnecessary port is opened, it could become a security hole.

3.4.1 Network access control

Ports, which do not provide a service, are not opened. Moreover, any port unnecessary for operation can be closed by using the administrator setting. Protocols not to be used should be disabled as much as possible. Moreover, unnecessary ports should be closed.

3.4.2 IP address filtering and MAC address filtering

IP address filtering and MAC address filtering are supported. Only an access request from a network node, such as a client PC, with an address registered in the MFP is accepted or access from a registered address can even be refused. Due to this, access from a malicious network node can be restricted. Moreover, a function which accepts an access request only from a client PC with a specific IP address or MAC address registered in the MFP, and one which does not accept an access request from a client PC with a specific IP address or MAC address registered in the MFP, are both supported.

From the e-STUDIO5005AC Series, the filter can be set to each port. It also can be set for a rejection of the response to ICMP.

3.4.3 Communication path protection (wired LAN)

Encrypted communication that flows over the network can protect communications. Although communication data can easily be wiretapped when the Network Trace Tool is used, through encryption, it will not be stolen even when wiretapped.

3.4.4 SSL (Secure Socket Layer) / TLS (Transport Layer Security)

Since TOSHIBA MFPs support up to TLS1.2, SSL3.0 whose vulnerability has been discovered is not used.

SSL/TLS communication is supported in HTTP Server/Client, IPP, LDAP, SMTP Client, POP3, FTP Server, Web Service Print, FTP Client, Web Services Scan, Syslog and SOAP.

In the HTTP Client function, SSL/TLS encryption is also carried out for access to TopAccess.

Encryption communication by HTTPS is also used to access AddressBook Viewer.

In IPPS, SSL/TLS encryption prevents print data from being wiretapped.

In POP3/SMTP, SSL/TLS communication prevents e-mail data from being wiretapped.

The FTP server function is used for backing up or restoring FTP print data and e-Filing Box data. SSL/TLS encryption can prevent these data from being wiretapped.

In Web Service Print, SSL/TLS encryption can prevent print data from being wiretapped.

In Web Service Scan and TWAIN Scan, SSL/TLS encryption can prevent data via Remote Scan from being wiretapped.

In FTPS, communications in Scan to Remote can be encrypted.

This MFP supports POODLE and FREAK. Therefore, lower security encryption and transmission systems such as SSL2.0/3.0 or SHA-1 are not used.

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, TLS1.2 and TLS1.3 have been supported.

3.4.5 IPsec (IP Security Architecture)

IPsec (IP Security Protocol) protects communication in the IP layer. It is said that the person who sends/receives data is authenticated, and non-repudiation is protected in order to secure confidentiality and entirety.

Both AH (Authentication Header) and ESP (Encapsulating Security Payload) security protocols are supported. AH secures the entirety of IP Packet, and ESP secures the confidentiality and entirety of IP Packet. For Key management protocol together with IPsec used, both IKEv1 and IKEv2 are supported. In the installation of the certificate, Import or SCEP can be utilized.

3.4.6 Wired IEEE802.1X

IEEE802.1X is a standard for authentication utilized in LAN connecting. As IEEE802.1X is well known for user authentication specification in wireless LAN such as IEEE802.11b, the specification itself is correspondent to wired LAN. It consists of supplicant, 802.1X switch, and authentication server. IEEE802.1X does not accept any communication from clients who are not certified, but it does accept communication from users to be certified.

EAP (Extensible Authentication Protocol) is used to transmit an authentication message. EAP authentication has EAP-MD5 and EAP-TLS methods.

There are some EAPs to be utilized in 802.1X, and both the supplicant and the authentication server need to be correspondent to EAPs. Currently EAP-MD5, MSCHAPv2, EAP-TLS, EAP-TTLS and PEAP are supported. In installation of the certificate with EAP-TLS, EAP-TTLS and PEAP used, Import or SCEP can be utilized.

3.4.7 Network authentication

LDAP authentication supports CRAM-MD5, Digest-MD5 and Kerberos to protect the user name and password required for access to an LDAP server.

SMTP authentication supports CRAM-MD5, Digest-MD5, Kerberos and NTLM (IWA: Integrated Windows Authentication) to protect the user name and password required for access to an SMTP server.

POP3 authentication supports Kerberos, NTLM (SPA: Secure Password Authentication) and APOP to protect the user name and password required for access to a POP3 server.

SMB authentication supports NTLMv2 and Kerberos.

Dynamic DNS supports Secure Dynamic DNS (Domain Name System). When Secure Dynamic DNS is used, only the MFP in which the resource record has been registered or device with management authority for a DNS server can update zone information.

SNTP supports SNTP authentication, enabling authentication of an SNTP session between the MFP and an SNTP server.

3.4.8 SNMPv3

Network Protocol SNMPv3, which has both a data encryption and a user authentication function, enhances security features.

3.4.9 Communication path protection (wireless LAN)

This function encrypts wireless communication to prevent decryption and access by a third party. It can also allow communications only with a pre-permitted party when a connected party is authenticated. Since wireless communication is performed by radio waves, communication could be intercepted in radio wave service areas.

To prevent unauthorized usage by a third party, such as a falsification of data and spoofing, a wireless LAN option supports WPA/WPA2 Mixed Mode and WPA2, which encrypts communication data and allows user authentication for a communication party.

WPA and WPA2 are security standards established by Wi-Fi Alliance. WPA was created as a subset of IEEE802.11i, especially for improving user authentication and encryption. Later on, WPA2 that completely complies with IEEE802.11i was released. Compared with WPA, WPA2 provides more enhanced encryption and connectivity. Two connection methods are supported, as follows. WPAPSK allows user authentication and encrypts data when a "passphrase" shared between an access point and a client PC is preset. "Passphrase" is an optional character string set with from 8 to 63 characters. In addition to WPAPSK, a stronger security system (802.1X authentication) through a RADIUS server (authentication server) is supported. This is a connection mechanism, which verifies if the connected access point and the client PC are mutually appropriate parties.

As 802.1X authentication systems, EAP-TLS with a digital certificate and PEAPv0/EAP-MSCHAP v2 with a password are supported.

To make 802.1X authentication faster, WPA2 optionally supports Pairwise Master Key (PMK) caching. PMK caching stores authentication results including an encryption key to connect to a wireless LAN access point smoothly even if the location is changed. Moreover, a countermeasure to KRACKs which is the vulnerability of the wireless LAN has also been adopted.

3.4.10　Secondary Ethernet (2nd NIC)

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, one MFP can be used in two different networks by connecting the secondary Ethernet kit.

The primary (existing) and secondary Ethernet are independent. Therefore, the MFP does not route its respective network communications to another one. Due to this, it will be impossible to break into the network from another one via the MFP.
3.4.11　SMBv3

In addition to v1 and v2, Network Protocol SMBv3 which has a data encryption and enhanced security features has also been supported. Moreover, it is possible to disable SMBv1 which has become vulnerable.

3.5　Telephone Line and IP Fax Access Control

A fax function is equipped in some MFPs as an option.

3.5.1 Telephone line access control

Regarding telephone line access, the MFPs do not accept another protocol, only the fax. The current fax board supports only a standard G3 fax and the unique procedural protocol of Toshiba Tec. When a connection is made to machines other than a regular one or a TOSHIBA one, the protocol cannot be established. As a result, it becomes a communication error and the line is disconnected. Therefore, you will not be able to access the network through the fax board from a telephone line. Furthermore, there is no chance of improper data becoming

mixed. Remote-Maintenance from the fax line is not supported.

3.5.2 IP Fax access control

For the IP Fax function, a transmission/reception via a SIP (Session Initiation Protocol) server, via Gateway and direct transmission/reception are available. In addition, it can be set to receive only a SIP message from a SIP server which has not been registered in consideration of the security.

3.5.3 Prevention of Fax and IP Fax mis-sending to other destinations

There is a possibility of a leakage of confidential information to an unintended address due to misdialing or misoperation when a fax or IP Fax is being sent. Various functions are provided to prevent this.

If this is required, ask your service technician to change the setting. Then the following options to prevent fax mis-sending operation will become available.

- A confirmation screen is displayed before the [START] button is pressed after the fax number is entered.
- A confirmation screen is displayed before the [START] button is pressed after the abbreviated dial or one-touch entry. After confirming, press the [START] button to send the fax.
- In case of sending a group broadcast transmission, a screen to confirm the selected group is displayed. Press the [START] button again to send the fax.
- One is not allowed to operate the [START] button while being on-hook or holding up an external telephone receiver. Moreover, there is a refusal sound and the operation is prevented even when the [START] button is pressed. (IP Fax is not supported.)

4. ACCESS SECURITY

The access security accepts the access for specified users who have an access privilege to designated data or devices. The access to the device is controlled in the following three levels.

- The access to our MFPs is limited to only authorized persons or sites where it is physically or digitally available.
- Security policies are centrally managed and thereby ensure the highest level of access security.
- By monitoring the access to the MFPs, our security system proactively sends alerts to any unauthorized access.

4.1 Limitation of Use

4.1.1 Role-Based Access Control

Unauthorized usage of the MFP may cause information leakage from a copying, printing, scanning or e-Filing box operation. To prevent the leakage, the available operations by a user can be restricted.

After user authentication is completed through the control panel or TopAccess, the only operations (objects) that are only permitted are copying, printing and faxing. For example, copying, printing, fax and IP Fax transmitting and receiving and black output are available, while scanning and color output are prohibited for User B.

Setting of the role for users (which means the role of users, and which is able to be set for the administrator or the general user or pertinent section) is available in the centralized managed directory database LDAP (including the Active Directory LDAP function). Moreover, an attribute which an LDAP server has already had beforehand can also be utilized as a role.

When logging in the MFP with the user authentication function, the MFP acquires the role information already allocated to a user in an LDAP server, and checks the access rights allocated to its role from ACL (Access Control List) and gives usage permission for each function to the user. The 20 settings are available access rights to be allocated in the role: e.g.: Device setting, Copy, E-mailSend, FileSave, iFaxSend, Print, e-Filing, FaxSend, Color output (Copy, Print), Remote Scan, USB Print/Save, Editing Address Book, Log management. As the setting of the role information can be allocated to the access rights to all users' attributes set in the existing LDAP server, configuration of a new LDAP server is not required and you can set it securely. In addition, the roles will be set in local authentication or created by the administrator.

Role-Based Access Control
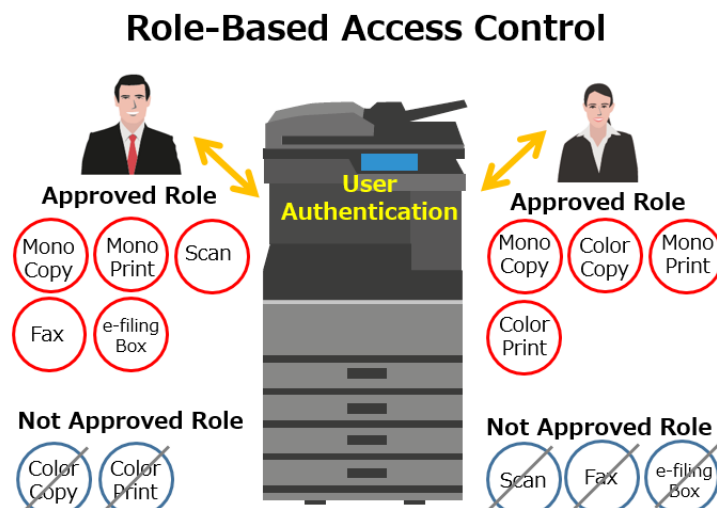

4.2 Log Information Access

Operations on the control panel and in TopAccess can be recorded as logs in order to prevent unauthorized usage of the MFP and ensure traceability.

By enabling user authentication, the history of the operations (copying, printing, scanning, fax and IP Fax transmitting and receiving) by the user and failure logs can be recorded. Thus, unauthorized access or fraud can be detected. On the control panel or in TopAccess, obtained logs can be observed. When user authentication is enabled, users can only browse their own job logs.

When user authentication is disabled, job logs can be switched between visible and hidden, allowing administrators and auditors to browse all logs.

Various security logs are added.

From the e-STUDIO5005AC Series, the Syslog has also been supported.

4.3 Identification Authentication

4.3.1 User authentication function

A user authentication function is equipped in the MFP in order to prevent unauthorized access to the MFP. The user authentication function provides the following user management tasks:

- Restricting operations on the touch panel
- Restricting access to MFP configuration or log information
- Restricting available operations (copying/printing/scanning/faxing) by users (Role-Based Access Control)
- Logging operations by users
- Managing the counter by users
- Necessity or lack thereof for setting of user authentication at each function
- Personal authentication by an NFC function from an Android mobile terminal is available, instead of entry of the password.

4.3.2 Authentication methods

The following authentication methods have been supported.

- Department code authentication
- User ID/password authentication
    - Local authentication (authentication is performed by the MFP itself)
    - Windows domain authentication (a Windows server is used as an authentication server)
    - LDAP server authentication (an LDAP server is used as an authentication server)
- PIN authentication
- IC card authentication
- Two-factor authentication using an IC card and PIN
- Authentication using an NFC function with an Android terminal
- Fingerprint authentication
- Two-factor authentication using fingerprints and an IC card or PIN

19

4.3.3 Restriction on operations by user authentication

Operations on the touch panel can be restricted by first having an authentication screen displayed. It is possible to set whether the authentication screen is to be displayed or not when each function button (COPY, SCAN, PRINT and FAX) is pressed by setting the user authentication for each function of the MFP.

4.3.4 Registration and management of user information

There are two methods to register/manage user information utilized in user authentication:

1) Regarding department management, up to 1,000 departments can be registered and used. Also, up to 10,000 users can be registered in the MFP.

2) It can be coordinated with the user authentication system established in the corporation. Available user authentication systems are the Windows authentication system (Active Directory) that is generally widely used for directory services and LDAP.

As for the authentication method, in addition to entering an ID and password on the keyboard, a non-contact IC card MIFARE/HID etc., which provides both convenience and security, can be used as an optional authentication device.

This authenticates users and allows them to use the MFP just by holding an IC card MIFARE/HID onto the card reader connected to the MFP, eliminating a cumbersome password entry on the control panel. Also, as the existing corporate ID card (MIFARE/HID, etc.) used to enter/leave a room can be used for operating the MFP without making any changes and this method can be introduced at low cost.

4.3.5 Password policy setting

The following password policy can be set when local authentication is performed. Due to this, a more difficult password can be set in local authentication.

- Minimum password length
- Password validity period
- Character strings whose use in the password is prohibited
- Number of the lockout times and the lockout period caused by a login failure

4.3.6 Fingerprint authentication

A user can be authenticated by collating the fingerprint information registered in the MFP beforehand with the one scanned by a fingerprint reader. Moreover, you can log into the MFP by two-factor authentication, using IC Card or PIN together while fingerprint authentication is being carried out. A fingerprint image scanned by a fingerprint reader is converted into a file (fingerprint template) which cannot identify individuals and is stored in an internal storage device of the MFP. At the same time, since the scanned fingerprint image is discarded without saving, personal information related to a fingerprint will never be leaked.
4.4 Tracking

4.4.1 Tracking by image logs

To ensure the traceability of the MFP's copying, scanning, faxing and IP faxing data, they can be stored as image thumbnail data along with the job information.

When copying or scanning is performed or a fax or IP Fax is transmitted or received in the MFP, the data can be transmitted to a designated external server as the image thumbnail data along with the job information (date and time, user name, file name, serial number of the MFP). This function enables the tracking of data if an information leakage does occur subsequent to copying, scanning, faxing and IP faxing with the MFP.

In order to prevent information leakage resulting from the improper use of this function, it is disabled by default. Ask your service technician to enable this function if you want to use it.

4.4.2 Tracking by forced printing

To enable the tracing of the MFP's copying and printing documents, information such as the date and time, user name, etc. can be forcibly added onto them.

Forced printing of the date and time, user name and card ID enables the tracking of the data related to who has performed output copying, printing, fax and IP Fax transmission as well as when.

4.4.3 Security function during E-mail transmission

Unauthorized usage of the Scan to E-mail function may cause an information leakage through E-mails or wiretapping. To prevent this problem, the Scan to E-mail function provides a security function for E-mail transmission.

The following security functions are supported for e-mail transmission in the Scan to E-mail function of the MFP.

4.4.4 E-mail authentication

As the authentication systems, standard protocols (POP before SMTP, SMTP Authentication (LOGIN/PLAIN/CRAM-MD5/Digest-MD5/Kerberos) and LDAP Authentication (LOGIN/PLAIN/CRAM-MD5/Digest-MD5/Kerberos)) are equipped in the MFP, thus the protocols can be selected in accordance with the corporate policy.

4.4.5 BCC transmission function

The BCC (Blind Carbon Copy) function is also available for transmitting internet faxes as well as the E-mail transmission.

5. DOCUMENT SECURITY

Not only the security of the MFPs themselves, but also the security of your documents is also ensured during the entire lifecycle. Your sensitive documents are consistently protected when they are entered in, stored on, and leave the MFPs in any physical or digital means such as printing, fax, scanning, copying and so on.

5.1   Security in Printing

5.1.1 Secure printing function

When user authentication is disabled, private printing is used to transmit print data with a password up to 64 alphanumeric characters from a client PC to the MFP, the transmitted data are stored temporarily in the HDD of the MFP. Unless the password is entered from the control panel, printing will not start.

When user authentication is enabled, hold printing, private printing or multi station printing (optional) is used to allow users to command only print jobs sent on their own without entering a password for private printing, after logging into the MFP. By setting the MFP to require a user name and a password when a job is sent to the MFP from a printer driver, user authentication is available for a shared client PC used by multiple users.

In addition, users can command their own print jobs by simply holding an IC card over the control panel instead of performing user authentication, through the use of an optional authentication non-contact IC card device, MIFARE/HID, etc. Once logged in, users are also allowed to automatically to output their print data without sending a print job. Secure printing can be switched to forced private printing or forced hold printing.

The e-Filing box with a password, private printing, hold printing or multi station printing function is used to store or print confidential documents.

The administrator configuration allows all jobs to be temporarily stored in private, hold or multi station queues, and then released as desired, instead of being immediately released.

Document or user names can be hidden on the status screen to ensure security.

5.1.2 Hardcopy security printing

The Hardcopy Security Printing function embeds a particular fine dot pattern on documents during printing. When they are copied, hidden characters emerge. Due to this, this function can effectively restrict unauthorized copying and prevents the leakage of information printed on the document.

In addition to this, GA-1190A (optional) can also prohibit unauthorized copying and perform information tracking. An embedded fine dot pattern is added to a document during printing by specifying Hardcopy Security Printing in a printer driver. When this printed document is copied, the pre-embedded character string "COPY" will conspicuously appear to restrict information leakage caused by unauthorized copying. Moreover, when attempt is made to copy, fax, IP Fax or scan a printed document on a TOSHIBA MFP equipped with a copy prohibiting function, the operation stops if this pattern is detected. As a result, the security of confidential documents can be strictly maintained. If this printed document is left unattended, and the scanned image data on it are analyzed using an optional software item, such as "when", "who", "what", "which client PC to create" and "which MFP to print", they are retrieved and displayed on the client PC screen.

5.1.3 Confidential document access control

With regard to images stored in the HDD, access restriction must be password authenticated. Image data that need to be handled as confidential documents will be protected from leakage and falsification by a third party.

5.2   Scan Data Security

5.2.1 e-Filing box with a password

Setting a 64-digit password into the HDD of the MFP can create an e-Filing box. The file stored in the e-Filing box can be printed from the control panel. Thumbnail display from a client PC Web browser and editing can be access restricted by the password. The password policy can be applied to a password of the e-Filing box.

5.2.2 PDF file security

5.2.2.1 PDF encryption

This function is available to protect PDF documents by a password, encrypt them and restrict the operation by selecting this during scanning. By entering the password (user password), the encrypted PDF file can be opened. The encryption level is 128bit RC4, 40bit RC4 and 128bit/256bit AES. Operation restrictions can be set for Print, Documents Change, Contents Extraction and Accessibility, respectively. The restriction setting information is protected by the password (master password). If an encrypted PDF file is sent to a wrong destination or sniffed, this function prevents users who do not know the password from viewing it. This function also protects distributed PDF documents from unauthorized printing or tampering.

5.2.2.2 PDF with a digital signature

A PDF file with a digital signature, which is designated to prevent PDF documents from being tampered with and to guarantee their originality, can be created. Certificates which are used for a digital signature can also be created by the function in the MFP. Certain certificates can be imported, too. A PDF file is made by the encryption method RSA2048 when certificates created by the function in the MFP are used.

5.2.3 Confidential setting of document name and user name

This function allows one to indicate a document name, a user name and a destination by "*" when a job state or log is displayed on the touch panel or TopAccess.

5.3 Protection of Fax and IP Fax Received Data

Some customers may be concerned about the leakage of confidential information when receiving faxes and IP faxes that are printed during holidays or at night. Making the setting of the following functions will prevent the leakage of confidential information.

5.3.1 Fax and IP Fax secure receiving function

The start time (SECURE RECEIVE ON STATE) and end time (SECURE RECEIVE OFF STATE) can be set for days of the week in the administrator mode.

- When this function is enabled, received data are stored in the MFP instead of being automatically printed.
- When this function is disabled, received data are immediately printed.

While this function is enabled, received fax and IP Fax data are printed in the following cases.

- By entering a password while this function is enabled
- Printed automatically when this function is disabled

The function is automatically disabled when the fax hold function is enabled. Such data are stored in the fax hold queue when the fax hold function is enabled even if the fax secure receiving function is enabled and a schedule is set.

When data are received while the secure receiving function is enabled, a message indicating the presence of received data appears at the bottom of the touch panel of the MFP.

The message remains until all data are printed. When data are received while the secure receiving function is enabled, the PRINT DATA lamp is also turned on. This lamp remains on until all data are printed. The lamp remains on when the MFP goes into sleep mode even if received data are present. The lamp is turned off; however, when the MFP goes into super sleep mode while received data are present.

5.3.2 Fax hold function

The fax hold function is used to prevent the leakage of confidential information received by fax and IP Fax. The fax hold function can only be enabled by a service technician. Therefore, if you need to use this function, contact your service technician.

When the fax hold function is enabled, fax and IP Fax received data are always stored in the fax hold queue. Users initially registered as "Faxope" users, or users assigned as "Fax Operator" can print out the data stored in the fax hold queue. To print out the data, click [Print] and select [Hold print (Fax)]. The "Fax Operator" role can be assigned to any user using the administrator mode.

When the fax hold function is enabled and fax and IP Fax received data are present, a message indicating the presence of received data appears at the bottom of the touch panel of the MFP and the PRINT DATA lamp is turned on.

6. MEASURES TO VULNERABILITY

6.1 Provision of the Security Patch

If a vulnerability has been disclosed in the firmware, a security patch against it will be timely provided.

6.2 Malware Targeted at Windows

Some customers may be concerned about infection of network viruses (worms) such as WannaCry or infection from websites (TopAccess) targeting Windows. They may also be concerned about countermeasures against viruses that invades MFPs via a USB storage device.

MFPs are not affected by network malware (viruses, etc.) targeted at Windows. For example, they are not affected by WannaCry.

6.3 Vulnerability to OSS

MFPs use some open sources (OSS). Countermeasures to vulnerabilities to these disclosed OSS have been taken one by one. Cross-Site Request Forgery, Cross Site Scripting, SQL Injection and OS Command Injection are well-known vulnerabilities. Countermeasures to them have been taken in MFPs. In addition, countermeasures to the following vulnerabilities reported by the press have also been taken. POODLE, FREAK, GHOST, Heartbleed, Shellshock, KRACK, Faxploit, KNOB

6.4 Invading of Viruses from a USB Port

Countermeasures against viruses that make their invading to MFPs via a USB storage device have also been taken. In USB Direct printing, a file is handled as print data. Therefore, even if Malware or scripts are included in the file, only an image drawing error will occur. Malware or scripts are not executed.

When Scan to USB is performed, the file is just loaded from the MFP to a USB storage device. Malware in the USB storage device is not operated.

Due to this, Malware or scripts in the USB storage device are not executed.

6.5 E-mail

Since the MFP has functions such as receiving e-mails, printing attached files and storing into an e-Filing box, some customers may be concerned about virus infections occurring when they receive e-mails.

In the e-mail receiving function, an attached file is handled as print data. Therefore, even if malware or scripts are included in the file, only an image drawing error will occur. Malware or scripts are not executed.

6.6 Cyber-attack Assessment

A cyber-attack assessment to TOSHIBA MFPs has been carried out by technical experts from the security group of Toshiba RDC (Research & Development Center). We have confirmed that there is no problem posed by these cyber attacks conducted by security experts.

6.7 Vulnerability Confirmation by Tools

Tests which use a vulnerability scanner and fuzzing tool have also been carried out and countermeasures have been created for all the detected problems.

6.8 Tampering Prevention of Firmware

The integrity check function has been embedded in TOSHIBA MFPs to verify the tampering of the firmware controls of the MFP with the operation of an administrator at startup or during the operation. With this function, the MFP verifies the hash value of the firmware. If the hash value does not match, a service call is generated and the operation of the MFP stops. In addition, when the firmware is updated, the installation is attempted after the digital signature is verified since it is added to the firmware. Due to this, no unauthorized firmware will be installed. From the e-STUDIO6525AC Series and e-STUDIO6528A Series, Secure Boot using the TPM has been supported. Since the hash value of the integrity check performed at startup is protected by the TPM, higher safety will be ensured.

6.9 Anti-malware

From the e-STUDIO6525AC Series and e-STUDIO6528A Series, an anti-malware function has been supported. By embedding a Toshiba whitelist-type anti-malware tool, any executable modules other than the regular ones registered in the whitelist cannot be executed. Therefore, the execution of unknown malwares can be rejected, misdetection will not occur and the updating of a definition File is not required.
7. SOLUTION PLATFORM SECURITY

7.1   e-BRIDGE Open Platform Security

In e-BRIDGE Open Platform, Meta Scan function (GS-1010, optional) and Embedded Web Browser function (GS-1020, optional) which provides Embedded Web Browser and Web Service interface are supported. By using the user authentication function which can be limited to operate the control panel of the MFP, the security of these functions can be maintained. After a scanning operation, confidential data to be stored are protected from falsification and leakage by a third party.

In department management or user authentication, neither Embedded Web Browser nor Meta Scan function can be used without authentication.

7.2   Embedded Application Platform

The Embedded Application function allows one to install additional applications in the MFP and utilize them. This function equips the following features to protect the customers' MFPs.

7.2.1 Installation Control

Installation and uninstallation of the embedded applications can be performed only by an administrator or service technician such as a user with an MFP management privilege. Installation and uninstallation is controlled so that a user with no MFP management privilege cannot make to do so. Therefore, it will be possible to prevent the operation of unintended applications by an administrator on the MFP.

7.2.2 Consistency check of an application package

An application installer of the embedded applications allows to install only a package certificated by Toshiba Tec in the MFP. Therefore, this will prevent the installation of invalid applications such as falsified package and a one created by unknown creator in the MFP.
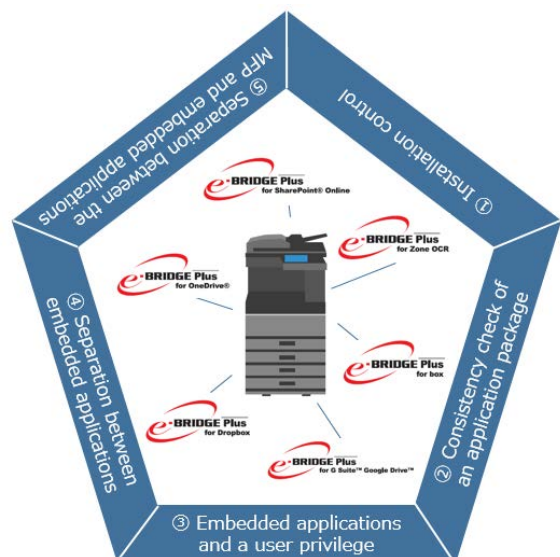

7.2.3 Embedded applications and a user privilege

The operation by general users is controlled. Therefore, even when they operate embedded applications which are performed on the touch panel of the MFP, they cannot perform the operations beyond the privilege given by role base user authentication of the MFP. Due to this, no operations which are not permitted to general users by an administrator can be performed through embedded applications.

7.2.4 Separation between embedded applications

File storages of which embedded applications can be operated are separated from each other. Even when multiple embedded applications are installed, accessing to each data item is not possible. Due to this, confidential data can be stored securely in file storages of the embedded applications.

7.2.5 Separation between the MFP and embedded applications

File storages of embedded applications and the MFP are separated in each other. Due to this, confidential data stored in the MFP cannot be viewed from the embedded applications directly.

Therefore, protection against the leakage of confidential data such as a user password from the embedded applications will be given. In addition, operation of the MFP from embedded applications is controlled by the above role base user authentication. Due to this, general users cannot perform viewing or operating of data beyond their given privilege.

8. REMOTE MAINTENANCE

8.1   e-BRIDGE CloudConnect Security

e-BRIDGE CloudConnect securely and reliably collects operation data transmitted from your MFPs.

e-BRIDGE CloudConnect uses the same principles used by client PCs accessing secure data over a browser with HTTPS (server authentication and encryption). Data can only be sent from MFPs and access is limited to e-BRIDGE CloudConnect servers with valid authentication certificates. This will provide very high-level security.

To prevent server spoofing and to make sure data are transmitted to the correct server, e-BRIDGE CloudConnect confirms that the e-BRIDGE CloudConnect server to be accessed is the actual one by performing the server authentication function with the MFP. All transmitted and received data are encrypted to preserve confidentiality and safety, and to protect against stealing, leaking and tampering.

In addition, Toshiba I.S. Corporation conducts routine independent security checks of the service.

e-BRIDGE CloudConnect only handles the MFP operation status information. This includes data concerning charging and maintenance such as information on counter data (the number of sheets used, etc.), MFP failures, consumables' replacements, MFP settings and adjustments. Since e-BRIDGE CloudConnect does not handle actual document data, copy, fax, print and scan data will never be leaked to a third party. On request, a service technician can set e-BRIDGE CloudConnect to permit or deny transmission. The MFP is operated and managed based on the system's security policy, in accordance with ISO 27001 international standard for information security management.

If a security issue has occurred, security patches can be distributed by using e-BRIDGE CloudConnect.
9. CLOUD CONNECTION

9.1 e-BRIDGE Cloud Login Security

e-BRIDGE Cloud Login is the cloud service to facilitate user login certification between TOSHIBA embedded MFP applications and customer public cloud services, securely, via your mobile device or PC.

All communications with the e-BRIDGE Cloud Login that is initiated by the embedded application is over secure HTTPS connections utilizing 256-bit ECDSA, and communication from the customer mobile device or PC uses 2048-bit keys to ensure industry standard level of security.

e-BRIDGE Cloud Login does not collect/store any personal information or document data.

The data used to provide this service is as follows:

- Access time
- Model name of MFP
- Serial number of MFP
- Application ID of the Embedded Application
- Authorization code

It does not contain any information that is able to identify an individual and is not re-used.

Credentials input from your mobile device or PC that initiate the Authorization code sequence are securely managed by your cloud service and are never passed through to the e-BRIDGE Cloud Login cloud service.

The e-BRIDGE Cloud Login service is hosted on AWS (Amazon Web Services) which complies with ISO/IEC 27001 (Information Security Management) and ISO/IEC 27017/27018 (Cloud Service Security).

For more details, please refer to the AWS site https://aws.amazon.com/security/

In addition, Toshiba I.S. Corporation conducts routine independent security checks of the service.
9.2 e-BRIDGE Remote Assist Security

e-BRIDGE Remote Assist is a function enabling the real-time operation of the control panel of the user's MFP in secure from a remote service.

e-BRIDGE Remote Assist uses the same principles used by client PCs accessing secure data over a browser with HTTPS (server authentication and encryption).

To make connection from the user's MFP to a server of the access, the user is required to enter an authentication code provided by a service. Therefore, connection cannot be started by a third party without permission. Due to this, a very high quality of security is achieved.

To prevent server spoofing and to make sure data are transmitted to the correct server, e-BRIDGE Remote Assist confirms that the e-BRIDGE Remote Assist server to be accessed is the actual one by performing the server authentication function with the MFP. All transmitted and received data are encrypted to preserve confidentiality and safety, and to protect against stealing, leaking and tampering.

Only data related to the operation screen of the MFP are handled by e-BRIDGE Remote Assist. Due to this, since the data such as customers' document information and address book in the MFP are not handled, copy, fax and scan data will never be leaked to outsiders even if this system is introduced. Based on customers request, a service technician enable e-BRIDGE Remote Assist function. The MFP is operated and managed based on the system's security policy, in accordance with ISO 27001 international standard for information security management.
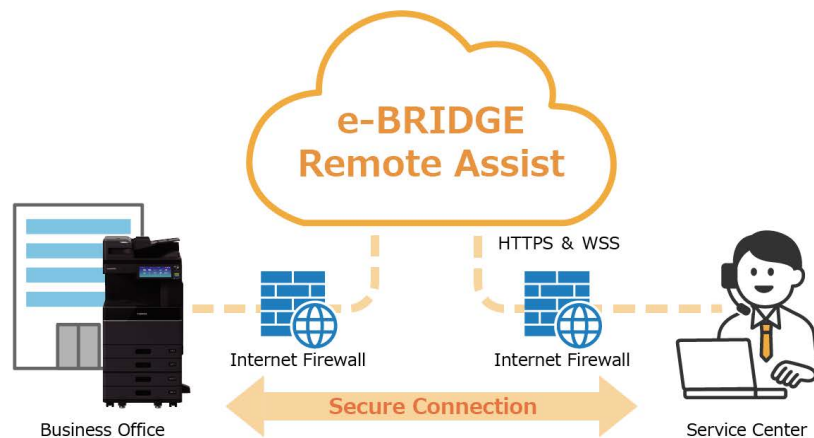

9.3   e-BRIDGE SKY Suite Security

e-BRIDGE SKY Suite allows you to access and manage the data and devices anytime and anywhere remotely, resulting in a considerable improvement in the operating effectiveness by reducing the cost and time.

e-BRIDGE SKY Suite is operated in the site certified with the ISMS (ISO/IEC 27001). The service group of e-BRIDGE SKY Suite is configured on Microsoft Azure and the security of the data center is always maintained up to date by Microsoft Azure. The back-up function provided by Azure is used to back up the database. The back-up data are all encrypted (AES256) and then stored in a storage location in Azure. Moreover, we do not have resources (devices, data storage, memory, files, etc.) which we will dispose of or reuse directly. We have confirmed that our contracted cloud service provider is properly disposing of or reusing resources in accordance with the contract.

Microsoft Azure AD B2C is used for user authentication of e-BRIDGE SKY Suite.

Microsoft Azure AD B2C is an ID management platform provided by Microsoft. By using OpenID Connect (OIDC), users can safely sign in to applications.

All user communications with e-BRIDGE SKY Suite are protected using HTTPS protocol supporting encryption at TLS1.2 or later only.

e-BRIDGE SKY Suite introduces a Microsoft Defender virus countermeasure to protect the system from malware (malicious software), viruses and other threats. Even in the unlikely event that a threat is detected, appropriate measures can be taken to respond quickly and prevent information leaks. In addition, to prevent security risks from cyber attacks and access to any important data, e-BRIDGE SKY Suite back end servers and database are disconnected from the internet by a virtual network (Vnet). Thus, it is protected to prevent direct access to important data.

In order to ensure the utmost security of the system, Toshiba I.S. Corporation performs vulnerability audits on e-BRIDGE SKY Suite prior to release and on a regular basis. WebInspect by Micro Focus and InsightVM by Rapid 7 are used as a vulnerability check tool to perform vulnerability assessments specific to web applications. Furthermore, WAF (Web Application Firewall) minimizes risks by detecting and preventing attacks that exploit web application vulnerabilities, including SQL injection and cross-site scripting.
9.4 e-BRIDGE Global Print Security

e-BRIDGE Global Print is a cloud service that allows you to upload documents from your mobile device or computer to a cloud server and print any Toshiba multifunction device in your group from them.

The communication in e-BRIDGE Global Print realizes high security by HTTPS communication (TLS v1.2) for both the communication between the server and your mobile device or computer, and the communication between the server and the multifunction device.

e-BRIDGE Global Print achieves both high security and easy-to-use operability by authenticating with OAuth2 using a Google account or a Microsoft account.

e-BRIDGE Global Print allows the connection only from multifunction devices that have been authenticated to the server based on the registration code issued in advance by the administrator. This prevents unauthenticated multifunction devices from connecting to the server.

e-BRIDGE Global Print is hosted on Microsoft Azure and data center security is always kept up to date by Microsoft Azure. Microsoft Azure complies with numerous certifications including ISO 27001, ISO 27018, SOC 1, SOC 2, SOC3, FedRAMP, HITRUST, MTCS, IRAP and ENS. For more information, see the following URL of the Microsoft Azure website.

https://www.microsoft.com/en-us/TrustCenter/Compliance/

Document data uploaded to e-BRIDGE Global Print is encrypted and stored in AWS (Amazon Web Service) S3 and cannot be accessed from the outside. AWS complies with ISO/IEC 27001 (information security), ISO/IEC 27017/27018 (cloud service security), etc. For more information, see the following URL of the AWS website.

10. REGULATORY REQUIREMENTS

10.1 MFP

10.1.1   ISO/IEC15408

ISO/IEC15408 (Information Technology Security Evaluation Criteria) is called as CC certification and is an international standard for evaluating and certifying the functionality and quality of IT products. The security functions and quality of certified IT products have been accepted in many countries participating in the Common Criteria Recognition Arrangement (CCRA).

EAL stands for Evaluation Assurance Level, which indicates the levels of assuring the evaluations. Target IT products are evaluated in accordance with the requirements defined by EAL. The higher EALs include the evaluations for the lower ones. However, EALs represent evaluation strictness, not security strength. Therefore, the level of the EALs is not always matched the security level of the evaluated products.

The products later than the e-STUDIO4540C Series and e-STUDIO6550C Series have obtained EAL3+ALC_FLR2 certification which conformed with IEEE2600.1.

The e-STUDIO5008LP Series have obtained EAL2+ALC_FLR2 certification which conformed with IEEE2600.2.

The e-STUDIO5015AC Series, e-STUDIO5018A Series, e-STUDIO7516AC Series, e-STUDIO8518A Series, e-STUDIO6525AC Series and e-STUDIO6528A Series have obtained a CC certification which conformed with HCD PP v1.0 (Protection Profile for Hardcopy Devices 1.0).

HCD PP v1.0 is a document collectively drawn up by the IT security agencies IPA (Information-technology Promotion Agency, Japan) and NIAP (National Information Assurance Partnership, U.S.A.), and companies of the digital multifunctional devices in Japan and U.S.A. and describes security requirements for government procurement of those devices. Various security functions and encryption requirements necessary for digital multifunctional devices are regulated.

10.1.1.1 JCMVP authentication

The JCMVP is a certification system operated by IPA (Information-technology Promotion Agency, Japan). This system certifies that the encryption module conforms with JIS X 19790 (ISO/IEC 19790).

It has been verified that each encryption algorithm has been implemented in the MFPs properly and the result has been registered in the following implementations of IPA.

KDF: Key Derivation Function

10.1.1.2 CAVP authentication (FIPS140-2)

The CAVP (Cryptographic Algorithm Validation Program) is a certification system collectively operated by NIST (National Institute of Standards and Technology, U.S.A.) and CSEC (Communications Security Establishment Canada). The certified encryption algorithm has been disclosed in the following URL of NIST.

Model Name	Validations Number	URL
e-STUDIO2010AC/2510AC e-STUDIO2515AC/3015AC/3515AC/4515AC/5015AC e-STUDIO2018A/2518A/3018A/3518A/4518A/5018A e-STUDIO5516AC/6516AC/7516AC e-STUDIO5518A/6518A/7518A/8518A	C374	https://csrc.nist.gov/projects/cryptographic-algorithm-validation-program/details?product=10734
	C375	https://csrc.nist.gov/projects/cryptographic-algorithm-validation-program/details?product=10735
	C376	https://csrc.nist.gov/projects/cryptographic-algorithm-validation-program/details?product=10736

10.2 Security HDD with the Wipe Function

The security HDD with the Wipe function used for GE-1230/1260 (option) has been given JCMVP authentication by IPA (Japan) and CMVP (FIPS140-2) authentication by NIST (U.S.A.), as a certification system of encryption products.

10.2.1 JCMVP authentication

JCMVP authentication is an encryption module certificate system based on JIS X 19790 (ISO/IEC 19790) carried out by IPA. It has been certified that AES, SHS, HMAC and DRBG have been properly implemented as encryption modules and the result has been registered in the following Cryptographic Module Validation List of IPA.

Model Name	Cert. #	URL
GE-1230, GE-1260 Toshiba Secure TCG Opal SSC and Wipe technology Self-Encrypting Drive (MQ01ABU050BW, MQ01ABU032BW and MQ01ABU025BW)	F0022	https://www.ipa.go.jp/security/jcmvp/jcmvp_e/val.html#F0022

10.2.2 CMVP authentication (FIPS140-2)

The CMVP (Cryptographic Module Validation Program) is a certification system collectively operated by NIST (National Institute of Standards and Technology, U.S.A.) and CSEC (Communications Security Establishment Canada). The certified encryption module has been disclosed in the following URL of NIST.

Model Name	Cert. #	URL
GE-1230, GE-1260 Toshiba Secure TCG Opal SSC and Wipe technology Self-Encrypting Drive (MQ01ABU050BW, MQ01ABU032BW and MQ01ABU025BW)	2082	https://csrc.nist.gov/projects/cryptographic-module-validation-program/Certificate/2082
GE-1350 (Phison SSD：PHSSS512GECTI-IA-TE1010）	3758	https://csrc.nist.gov/projects/cryptographic-module-validation-program/certificate/3758

10.3 HIPAA

The Health Insurance Portability and Accountability Act designed to ensure that patient information is treated with the highest level of confidentiality both within the healthcare organization and outside the organization. Toshiba security solutions offer various features that address the privacy and security of protected patient information. Secure device access, private printing capabilities, and an audit trail prevent improper device usage and only allow authorized users to receive the confidential data or documents.

10.4 GLB Act

The Gramm-Leach-Bliley Act directly relates to financial institutions, ensuring that consumers' are aware of how their personal financial information is being used and shared. The Financial Privacy Rule and Safeguards Rule govern the disclosure of private financial information and require all financial institutions to design and maintain systems to support the protection of customer information.

10.5 FERPA

The Family Education Rights and Privacy Act is a federal law that protects the privacy of student education records. This requires a heightened level of the security for educational institutions complying with the U.S. Department of Education. Password printing, controlled device access, data encryption and/or deletion ensure that sensitive information is not accessible on the multifunction devices.

10.6 The Sarbanes-Oxley Act (SOX)

Recently, stringent rules with the objective of changing financial practices and corporate governance regulations have been introduced. In response to high-profile corporate scandals, this has been passed to protect investors by improving the accuracy of corporate financial disclosures made in relation to the securities laws. Data security safeguards focus on restricting access to information, the tracking of data, and protection of data integrity.

10.7 DoD

The Department of Defense, directly under the President of the United States of America, formulates national security and defense policies. The Department of Defense Manual outlines rigid policies and standards in the interest of protecting the security of the United States. Toshiba's Disk Overwrite solution complies with the DoD standard of clearing and sanitizing a hard disk drive containing classified information.

10.8 California SB-327

Beginning January 1, 2020, this California legislative act requires a manufacturer of a connected device to equip the device with a reasonable security feature or features that are appropriate to the nature and function of the device, appropriate to the information it may collect, contain, or transmit, and designed to protect the device and any information contained therein from unauthorized access, destruction, use, modification, or disclosure, as specified.

10.9　Security in the Organization

As the information society advances, personal information is becoming an increasingly important asset. In the meantime, cases where personal information is illegally collected and used for unexpected purposes without notifying relevant individuals are increasing and the society is becoming more concerned about the handling of personal information.

Once a large amount of personal information leaks, the company will not only lose credibility but also fall into a dangerous situation that may cause serious damage endangering company's existence. It is a social responsibility for companies to establish a good relationship of trust with customers, make an effective use of personal information, and protect it as well.

Toshiba Tec provides products equipped with a wide variety of the aforementioned security features, to allow its customers to avoid information leak. Toshiba Tec will enhance the partnership with customers and move forward with implementing safer security measures.

Toshiba Tec recognized the importance of personal data protection at an early stage and established the Privacy Policy and the Personal Data Protection Guidelines as in-house regulations, in February, 2001.

The personal data protection system has been improved. The Privacy Policy was amended and published on the website in August, 2004. The Personal Data Protection Guidelines were significantly revised in accordance with regulatory requirements in November, 2004 and re-established as the Personal Data Protection Program (PDPP).

For details about Privacy Policy in Toshiba Tec, refer to the following URL.
